Algorithm Development

MARK URANAKA, *Vice President/Chief Technology Officer*

TeamPraxis has been contracted by HMSA to develop data reporting measurements that mirror those of CMS. Via TouchWorks, TeamPraxis physicians will be able to view a dashboard report of patients with certain chronic disease states. Diabetic, high cholesterol, CHF and CAD patients and their health states can be reported back to the physicians. For example, a physician will be able to view all his diabetic patients A1c levels, LDL's and blood pressure. The result of these reports will enable physicians to view cross sections of data for their entire patient population, generate health maintenance plans, follow-up reminders and provide a higher level of care not possible with paper charts.
