

Allscripts Clinical Quality Solution Powered by TeamPraxis

## Clinical Quality Solution Framework

### Allscripts Clinical Quality Solution Powered by TeamPraxis

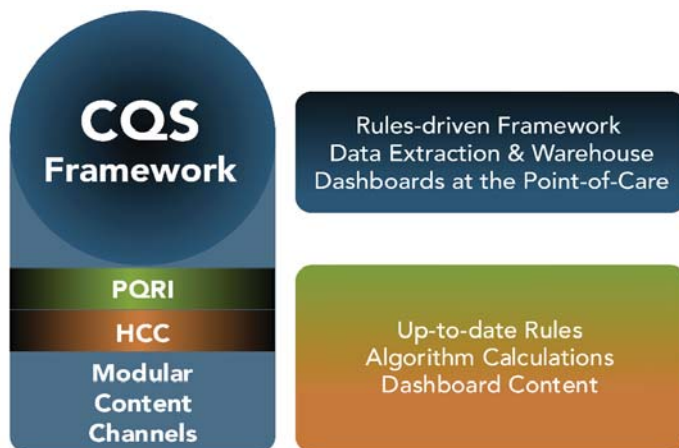

#### EMPOWERING PHYSICIANS WITH ACTIONABLE INFORMATION

Medical groups are participating in an array of quality data reporting and pay-for-performance initiatives while taking on more risk sharing with payers. Expanding and changing program rules and procedures are straining provider resources. Physicians are expected to support these initiatives, but lack tools that would make them efficient.

To eliminate the strain of this trend on physicians, the Allscripts Clinical Quality Solution (CQS) Powered by Team Praxis was developed. The Allscripts CQS features a modular framework with add-on content channels that support specific payer initiatives. Physicians need only document appropriate information within Enterprise EHR (formerly TouchWorks™) to support these initiatives and bring additional revenue to the group.

The CQS framework enables each content channel to present physicians with a real-time display of their patient information at the point of care. This patient dashboard provides actionable information for complying with one or more channel initiatives. Tools are also provided for quality and case management teams to quickly and easily identify patients needing follow-up care and then schedule appropriate interventions, assisting the physician with improving clinical outcomes and payer reimbursements.

Data is extracted nightly from Enterprise EHR and practice management without prompt and placed into a clinical data warehouse. This ensures up-to-date information on all dashboards.

For information, on the content channels, see the product briefs for the PQRI Channel and the HCC Diagnosis Recapture Channel.

*The CQS Framework enables each content channel to present physicians with a real-time display of their patient information at the point of care.*

### Benefits

- > Modular framework supports multiple initiatives including CMS PQRI and Medicare Advantage HCC
- > Content channels provide new revenue streams, effectively defraying the cost of an EHR
- > Rules-driven framework cuts through program complexity to display only relevant information and to generate results ready for transmission to P4P
- > Patient dashboard provides actionable information for physicians at the point of care
- > Physicians able to “drill-down” on individual patients and results, building confidence in data and providing decision support
- > Aggregate patient dashboard for case managers identifies patients needing interventions, improving clinical outcomes and maximizing payer reimbursements
